

## Skookum Creek Hydro

Squamish, BC

---

### PROJECT OVERVIEW

KTC Industrial Projects, in conjunction with Metro-Can Construction, completed the Powerhouse building which is 7,000 square feet.

The Skookum Power Project is a 25 MW run-of-river hydroelectric project that is located 11 kilometres east of Squamish in the Squamish Lillooet Regional District on Skookum Creek, a tributary that flows into the Mamquam River basin. It will deliver about 87 GWh of clean, renewable electricity to BC Hydro – enough clean, renewable electricity to power some 8,400 homes a year.

The project will use a low intake weir and rely on the natural grade and flow of the river. A portion of the flow will be diverted into a penstock, which conveys the water to a downstream powerhouse where the power will be generated.

CLIENT – Run of River Power Inc.
